

Approach Notes

Architecture

The solution uses a modular package structure with separate layers for CLI, services, intelligence, reporting and tests.

Source Rationale

Only public websites, user-supplied URLs, blogs, news pages and open business content are considered. When sources are unavailable, the project uses clearly marked input-based context.

AI Usage

The system performs extraction, summarization, classification, ranking, scoring and recommendation generation using deterministic AI-style intelligence logic.

Limitations

- Public source availability can vary
- Competitor discovery is strongest when service line and public URLs are provided
- Automated scoring should be validated by business users before final sales action

Future Improvements

- Add live search API integration through environment variables
- Add Streamlit UI
- Add richer competitor source fetching
- Add export to Excel and newsletter format
